Django Developer | Workflow Automation Builder | Process Improvement Specialist

cristinoagapitojr@gmail.com | +63 935-886-2771

github.com/tepong32 | sites.google.com/view/teppy

Systems-focused developer and process/operations specialist with strong experience translating real-world government and business workflows into practical software solutions.

Currently designing TracePoint, a Django-based citizen assistance lifecycle platform that I plan to pitch-in when completed, while continuously upskilling in Django & other Python frameworks, Linux deployment, and AI-assisted engineering workflows alongside full-time LGU service.

Education

Bulacan State University

Bachelor of Science in Business Administration
2007-2011

Tech Stacks

Professional Experience:

Accounting Clerk / Process Automation & Systems Support

Municipality of Bocaue (2022 - Present)

- Built process-improvement templates and validation workflows for accounting operations.
- Performed reconciliation and micro-auditing of municipal and barangay receipt records.
- Supported digital records integrity, reporting accuracy, and office technical troubleshooting.
- Designs Django-based civic workflow solutions outside office hours, including TracePoint.

BPO Operations

Conduent / Concentrix (2017-2019)

- Managed high-volume billing, AP, and customer workflows across chat, phone, and email channels.
- Introduced reusable response templates that improved CSAT consistency and team adoption.
- Strengthened process documentation, escalation logic, and issue-resolution workflows.

Earlier Roles – Banking & Data Operations

Accenture / Bank of America (2012-2014)

- Handled claims validation, account servicing, client education and payment workflow verification with high accuracy.

Selected Technical Projects

Excel Workflow Automation Toolkit (finished) – Tkinter + openpyxl

- a windows desktop app specifically designed to automate data sanitation, dynamically, on my daily collections report and salary reconciliation jobs at the LGU. The app mimics Excel features with file-based configs that applies/enforces custom “rules and requirements” I need for the reports I make.

TracePoint (WIP) – Django-based assistance request lifecycle platform

- originally planned as an Employee Management System (internally) coupled as a CMS for LGU announcements (externally) (see [the original concept](#) for the inspiration), I re-imagined how to ease the citizens' pain-points when requesting aids from the LGU. TracePoint aims to cut-costs, speed-up processing times, provide on-demand status updates for the requests and enforce accountability to the LGU staffs. These cores plus much more as the project develops into a SaaS-ready software.
